

# Project Title: Smart Express

TEAM NO.: 33

NAMES OF THE STUDENTS PARTICIPATED IN THE

TEAM: ARUNAV CHANDRA, SUKHPREET SINGH BHATTI,

ATHARVA MUGALIKAR, ATHARVA SARDE, GARGEE ATHALYE

COLLEGE: VISHWAKARMA INSTITUTE OF TECHNOLOGY, PUNE

SEMESTER: 5<sup>TH</sup>

DEPARTMENT: ARTIFICIAL INTELLIGENCE & DATA SCIENCE,

COMPUTER ENGINEERING & INSTRUMENTATION & CONTROL

CITY: PUNE

STATE MAHARASHTRA

PROJECT MENTOR NAME: DEEPIKA SINGH

## **Project Details:**

### **Problem Statement:**

The concerned idea is to optimize today's present inefficient system of collecting tickets in public bus transportation, while also handling security and improving the quality of the journey of the user.

### **Need of Project:**

1. During peak hours of traffic, it is difficult for the conductor to physically collect the tickets from each and every passenger.
2. It would prevent the malpractice of a passenger travelling without a ticket.
3. The present system utilizes paper in the form of tickets which is directly creating a burden on natural resources.

### **Proposed Solution:**

1. The proposed solution is a self-automated ticket-collecting system.
2. It would be divided into three parts, each having a unique functionality.
  - a. The driver's side of the solution would handle the QR code generation for the journey and keep getting updated at every stop till the journey ends.
  - b. The user's side of the solution would enable the user to select a stop of his/her choosing and load money into his wallet using razor pay.
  - c. The razor pay integration would handle all the monetary tasks and would ensure that there are smooth and easy transactions.
3. The solution would be integrated with geofencing for a smoother and easier execution, wherein the journey of a user would end if he/she crosses a certain threshold of distance from the bus.

### **Technology Used:**

#### **1. User Side:**

ReactJS, Material UI, Leaflet package.

Razor Pay for handling payment-related functions.

## 2. Driver Side:

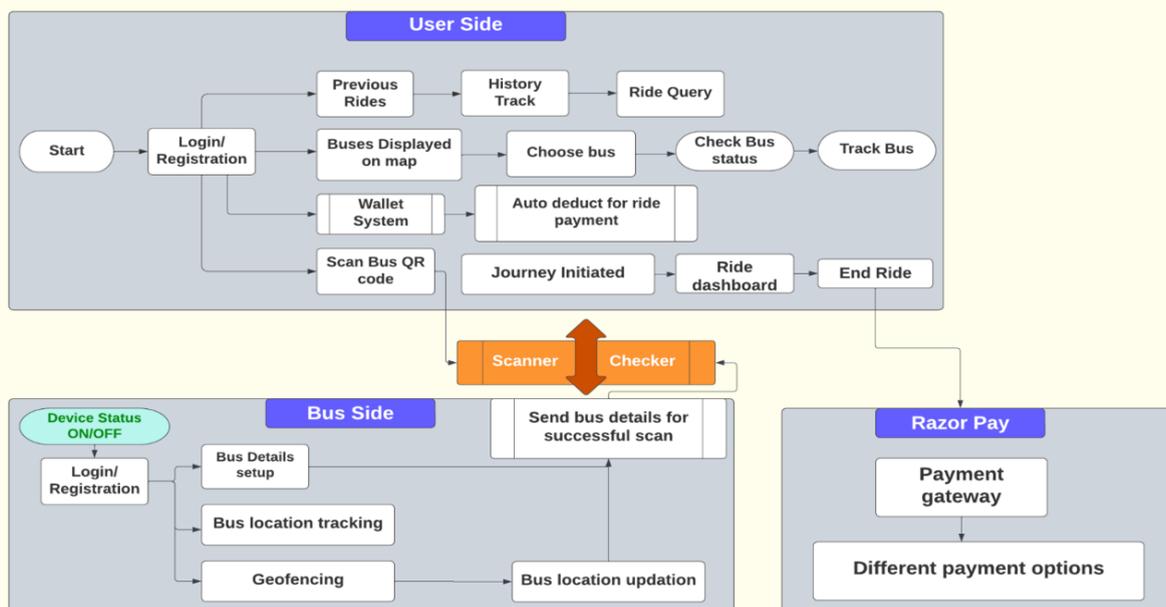

Kotlin, Firebase, Firestore, G-maps package, ML-Kit

ML-kit is used to create an OCR model which extracts the required information from bus passes or government ids(aadhar)

### Project Outcomes:

The project would revolutionize modern day bus tracking applications.

### Modelling:

1. The proposed solution is divided into two domains, each of which would handle a specific set of tasks.

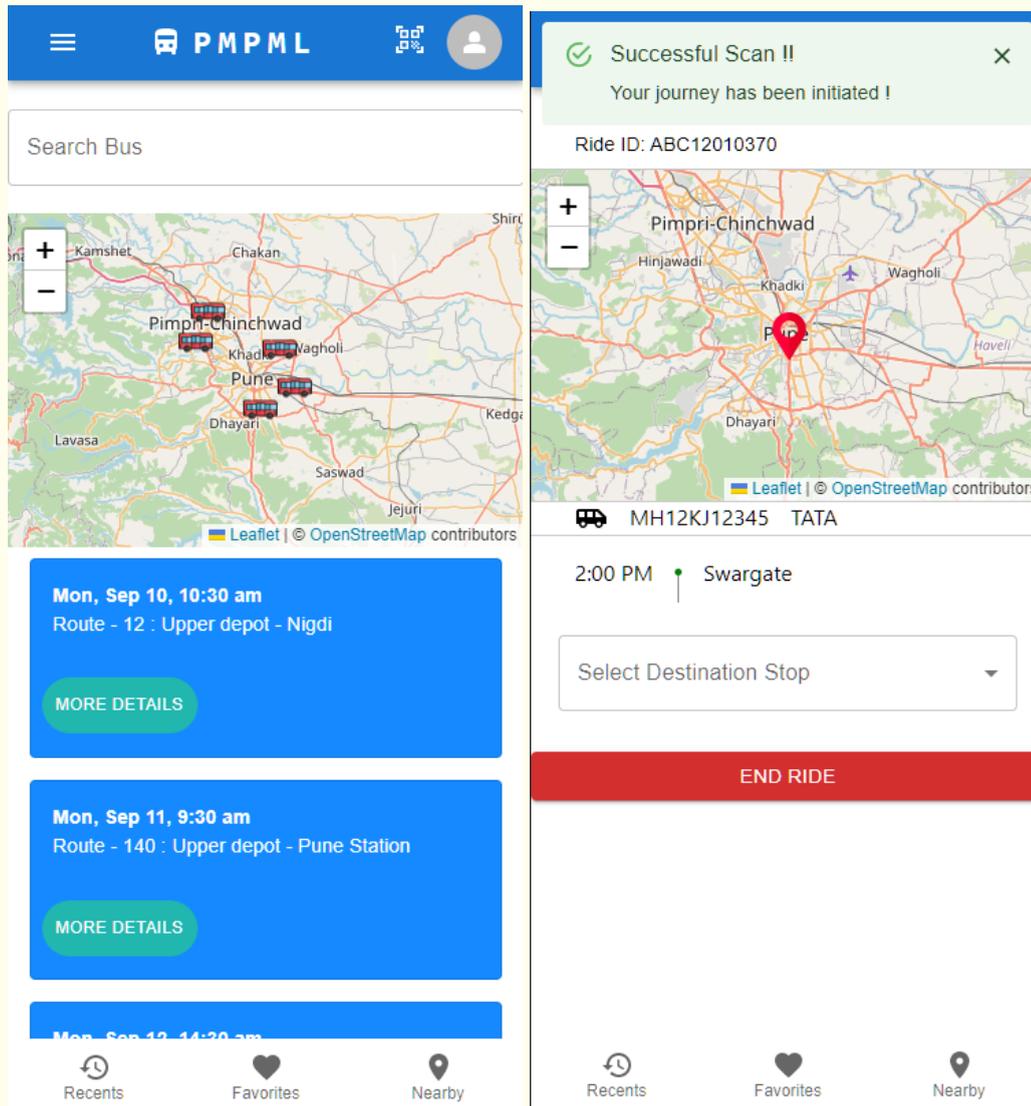

#### a. User Side:

- i. The user side of the solution would be used for scanning the QR code present in the bus and starting the journey.
- ii. It would be integrated with RazorPay for handling all transactions.
- iii. It will have login and register functions for users.

**b. Driver Side:**

- i. The driver's side would be responsible for generating the QR code for each stop, along with getting updated at each stop.
- ii. It would also be responsible for authenticating a user's Aadhar card to generate daily passes if the user wishes so.

**Results:**

Vodafone Idea Foundation

# \_VOIS

The screenshot displays the VOIS application interface. On the left, a blue header contains a menu icon, a bus icon, and the text 'PMPML'. Below this, the 'Journey Details' section shows a route from Swargate to Pimpri, with a duration of 5 km and 30 minutes. The 'Bill Details' section lists 'Cancellation Charges' for ₹ 15. The 'Payment' section indicates 'To be paid in the next ride' for ₹ 15, and the 'Total' is ₹ 30. At the bottom of this section are two buttons: 'PAY ONLINE' and 'WALLET PAY'. On the right, a white panel titled 'VOIS' shows a QR code for UPI payment with a 'Show QR' button. Below the QR code, there are icons for Google Pay, PhonePe, and other UPI apps. The 'Cards, UPI & More' section lists various payment methods: Card (Visa, MasterCard, RuPay, and Maestro), UPI / QR (Google Pay, PhonePe & more), Netbanking (All Indian banks), Wallet (Mobikwik & More), and Pay Later (Simpli, LazyPay, ICICI & More). At the bottom right, the total amount '₹ 30' is displayed with a 'View Details' link and a 'Pay Now' button.

## Future scope for project enhancement:

1. We would like to work towards making the application scalable, which could handle enormous amounts of requests at once.
2. We propose to integrate geofencing-based additional features such as alerts for the arrival of selected stops by a commuter.
3. We could also work towards implementing a physical smart card in our application, which would work even if a user's mobile is discharged.
